Whether you're a student, a professional looking to brush up on your skills, or simply curious about the world of accounting, this post will equip you with the practice you need to succeed.

Section 1: Fundamental Accounting Equations and Concepts

Let's start with the bedrock of accounting: the accounting equation. This simple yet powerful equation – $\text{Assets} = \text{Liabilities} + \text{Equity}$ – underpins all accounting transactions. Understanding it is crucial.

Practice Problem 1: A company has \$50,000 in assets and \$10,000 in liabilities. What is the company's equity?

Answer: $\text{Equity} = \text{Assets} - \text{Liabilities} = \$50,000 - \$10,000 = \$40,000$

Practice Problem 2: A business receives \$20,000 in cash from its owners as an investment. How does this affect the accounting equation?

Answer: Assets (Cash) increase by \$20,000, and Equity (Owner's Equity) increases by \$20,000. The equation remains balanced.

Section 2: Journal Entries and T-Accounts

Journal entries are the first step in recording financial transactions. Mastering them is essential for accurate financial reporting. T-accounts help visualize the impact of these entries on individual accounts.

Practice Problem 3: A company purchases office supplies for \$500 cash. Record the journal entry.

Answer:

Debit: Office Supplies \$500

Credit: Cash \$500

Practice Problem 4: Using T-accounts, show the impact of the above transaction on the Office Supplies and Cash accounts.

Answer:

Office Supplies

Debit		Credit
-------	--	--------

-----		-----
-------	--	-------

\$500		
-------	--	--

Cash

Debit		Credit
-------	--	--------

-----		-----
-------	--	-------

\$500		
-------	--	--

Section 3: Accrual and Cash Basis Accounting

Understanding the difference between accrual and cash basis accounting is vital. Accrual accounting recognizes revenue when earned and expenses when incurred, regardless of when cash changes hands. Cash basis accounting, on the other hand, recognizes revenue and expenses only when cash is received or paid.

Practice Problem 5: A company provides services worth \$1,000 on December 31st, but receives payment on January 15th of the following year. How is this transaction recorded under accrual and cash basis accounting?

Answer:

Accrual Accounting: Revenue of \$1,000 is recognized on December 31st (the date the service was provided), even though cash isn't received until later.

Cash Basis Accounting: Revenue of \$1,000 is recognized on January 15th (the date the cash is received).

Section 4: Depreciation and Amortization

Depreciation is the systematic allocation of the cost of a tangible asset (like equipment) over its useful life. Amortization is the same process but for intangible assets (like patents).

Practice Problem 6: A company purchases a machine for \$10,000 with a useful life of 5 years and no salvage value. Calculate the annual depreciation expense using the straight-line method.

Answer: Annual Depreciation = (Cost - Salvage Value) / Useful Life = (\$10,000 - \$0) / 5 years = \$2,000 per year

Section 5: Financial Statement Preparation

Financial statements, including the income statement, balance sheet, and statement of cash flows,

summarize a company's financial performance and position.

Practice Problem 7: Given the following information, prepare a simple income statement: Revenue \$50,000, Cost of Goods Sold \$20,000, Operating Expenses \$10,000.

Answer:

Income Statement

Revenue: \$50,000

Cost of Goods Sold: \$20,000

Gross Profit: \$30,000

Operating Expenses: \$10,000

Net Income: \$20,000
